I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Ava Collopy

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

S Brassel

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Tom Hougham

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Catherine Norton

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Pace Putland

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Natasha Williams

Please look to the future and invest in clean energy not new railroads to transport more dirty energy. Fossil fuels are dirty, unsustainable and need to be left in the past. Let the oil/coal companies know that if they want to invest wisely to invest in the clean energy. Humanity and planetary safety and first.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Kim Crawford

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

On a more personal note, I used to live in the Northwest. I think it important to maintain the area's natural beauty for future generations to enjoy. Increase use of coal would make the air dirty as well as pose a pollution risk in the Northwestern US. Oppose the coal trains and support the retention of the pine trees, snow-white mountains and clean air.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Exporting coal and moving it around the country and world exposes much more of the planet and the people on it to the dangers of coal.

Cutting back our own use of coal does little good if we just have other people burn that coal.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Sandra La Mont

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Angel Orona

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Bernard Rose

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Kristen Howard

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Dennis Clark

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Thank you,

Sebastian Rerak

Krakow, 30682

Victoria Rutson
Surface Transportation Board

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I live in the Columbia River Gorge, and coal trains go through here regularly. My friend who lives near the tracks in Bingen says there is fine, BLACK dust on everything in his house from the trains. One can only wonder about the dust along the tracks.

Railroads cause fires here on a disconcertingly regular basis . . . how good are the firefighting resources along this proposed rail line? Does it go through forests? I'm unwilling to sacrifice the trees of the Evergreen State (which help clean the air) to enable the export of air polluting coal! It makes NO sense to me!

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Pam Bath

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. It does not matter who burns this oil, it impacts us globally.
The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Gregory Gregg

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Francine DiBernardo

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Raymond Odle

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Ms Veeto

If Ohio was a stand alone nation, it would rank 15th in the world in CO2 and green house gas creation, mostly from the 20+ coal fired power plants within our borders. We, including our children, are sick from it. This assault cannot be passed on to unsuspecting people in other parts of the world. Let the coal stay in the ground.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Ruth Peterson

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Tracey Partin

MAITLAND, FL 32751

Victoria Rutson

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Timon Jansen

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Peter Dam

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Sharon Hudson

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

There is growing evidence, to me, that investment in alternative energies, both in what is currently available, but especially in research applications, nets a much better return for everyone in the long term. For both the health and sustainability of our environments now and far into the future as the smarter way to invest the use of our natural and financial forms of investment. Thank you for your consideration of this very important concern.

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I strongly oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

We do not need coal to export to other countries at the risk of injury and death to our country and environment! As leaders of the free world, isn't the USA a traditionally progressive country? Shouldn't we be putting our money into solar/wind/alternative energies, and not into pockets of "greed not need". We already have the resources, motivation, need and justification to do so. Let's stop this madness, now.

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly the primary reason for the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Diana Morales

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Denise Lytle

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Sherrie Roznieckі

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Karin Lawler

Victoria Rutson
Surface Transportation Board

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Alberto Acosta

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Stephen Greenwald

Victoria Rutson
Surface Transportation Board

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Debbie McCarthy

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

robert gensley

I am writing to express my strongest opposition tot the construction of the Tongue River Railroad, and urge the Surface Ttransportation Board of Montana to take the “no action" alternative.

If built, Tongue River Railroad would link several massive new coal projects – from the largest coal strip mine in North America to an export terminal in Washington. The mine itself would produce 2.5 billion tons of global warming pollution during its life. On top of that, it would lock us into over half a century of all the problems that come with coal mining: from coal dust to diesel exhaust, train derailments to decreased property values.

And when burned, carbon released from that coal into the atmosphere can never be taken back out. It will remain there for hundreds, perhaps thousands of years, enforcing an unlivable earth.

Specifically, the railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world -- just look up "coal futures" online. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would directly contribute to climate change for the next 55 years -- and indirectly for countless further years.
.
The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

It’s madness to build a new rail line just to open a new coal mine -- especially when we really need to be transitioning away from fossil fuels at full speed.

The TRR and coal export benefit only unaccountable private coal companies and Asian energy users while they hurt every one of us who breath our atmosphere, and especially those who live along the rail lines.

If we are to have the slightest hope of avoiding irreversible climate change, this mine and the proposed Tongue River Railroad must be rejected.

There is no Planet B.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. Domestic demand for coal is plummeting as American coal-burning power plants are being retired, because coal is the most air-polluting and worst greenhouse gas emitter of the fossil fuels. Coal exports are the coal industry's only hope to keep its production going, and they need new coal trains to take the coal to coastal export terminals.

But keeping up coal production is very much NOT in the public interest: coal is the oldest and dirtiest fossil fuel and we need to rapidly phase out ALL fossil fuels or wreak havoc on earth's future climate. Exporting coal will help only the coal companies, but coal burned overseas will be just as polluting and climate-damaging as coal burned here would be.

The Otter Creek mine is clearly a connected impact of the railroad’s construction; without a new rail line to take its coal to the coast, the environmental damage of Otter Creek operations would never have to happen.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years.
