I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Beppe Caturegli

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Surface Transportation Board

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Carina Perez

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

S Hill
Lowell St.
Somerville, MA 02143

Victoria Rutson
Surface Transportation Board

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

We need to look to an energy future without fossil fuels. Even China is doing so. Asia is clearly the main market for coal routed to the Pacific Northwest. I live in a town that currently has trains running through it night and day, at least one an hour, much of it due to a recent increase in coal transport by rail in the last ten years or so. The impact on communities of this frequency of rail traffic is extremely detrimental... just the sleep deprivation is daunting. We had to go through an expensive and protracted process to close numerous railroad crossings, then modify the roads at the remaining crossings in order to get the railroad to stop blowing their horns.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS WRONGLY ASSUMES that there is a DOMESTIC coal market for high-sodium Otter Creek coal, and WRONGLY ASSUMES ZERO TRAIN TRAFFIC IMPACTS from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail COMMUNITIES between the proposed railroad in Montana and Pacific Northwest export terminals WOULD SUFFER the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust, AND SLEEP DEPRIVATION, LOSS OF CREATIVITY AND PRODUCTIVITY, AND ASSOCIATED MENTAL HEALTH RISKS AND DAMAGE CONTROL.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Michael Bellmore

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Tom Johnson

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

ellen wade

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I strongly oppose construction of the Tongue River Railroad, and strongly urge the STB to take the “no action alternative.”

I oppose because this is proposed to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling- domestically and around the world. The Otter Creek mine is clearly a reason for the railroad’s construction.

As you know, Otter Creek is the largest proposed coal mine in the United States- expected to produce represents 1.3 billion tons of coal. If mined, that coal would contribute to climate change for the next 55 years.

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day. Therefor, the reasons for it are extremely weak.

More important, rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic- including decreased property values, increased traffic congestion, safety hazards as seen in the multiple recent explosions, and health hazards due to the air pollution from both diesel exhaust and fugitive coal dust.

Because the TRR and coal export only benefit private coal companies and Asian energy users, while harming those who live along the rail line, it is your job to say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Bibi Eng

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years.

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Dianne Ensign

My state of Maryland has a twenty-year contract with Japan to supply that country with LNG from our Cove Point terminal. Japan's ships will pull up, load, leave.
This doesn't mean that there is no room for error, but it does mean that fewer things would be in the way in case of a hazard, and that Japan wouldn't need more coal. More and more people are thinking that coal should be left in the ground, and mountains should retain their tops!

Thank you,

Constance Contreras

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Christie Childs

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Deepika Gupta

It's time we stop giving fossils fuel corporations the benefit of the doubt when elvauating new projects. We must look at all aspects of these proposed projects with a global, natonal and local fine toothed comb and with a long term perspective. Alternatives are in place rendering risky, polluting and poisoning proposals outdated, without merit and unjustified.

The following statement was written by the good people at Friends of the Earth. I have read this statement and heartily endorse it. We only have one home; we need to figure out how corporations can be viable and profitable WITHOUT endangering the viability of our ONLY planet!! What good is money, asset, profit, etc. if we kill the planet that sustains us???

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Mark George

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Linda D Prostko

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Take the “no action alternative” . The project is ill-advised because:

1. Coal markets are crumbling both domestically and around the world.
2. Otter Creek is the largest proposed coal mine in the United States.
3. Mining 1.3 billion tons of coal will impact climate change for the next 55 years.
4. The draft EIS is wrong to assume that a market exists for high high-sodium Otter Creek coal
5. The draft EIS is wrong to assume constructing a rail line for 18-26 additional coal trains per day will not impact existing train traffic.
6. To the contrary, the proposed railroad terminals would dramatically increase coal train traffic through communities near the track.
7. TRR harms American families who live along the rail line.
8. 18-26 daily coal trains would slash property values, diesel exhaust would pollute the air, coal dust would pollute the air, coal dust would drift onto the land and towns, traffic congestion would increase, safety hazards would increase.
9. TRR and coal export flow only to private coal companies and Asian energy users.

Say “no” Tongue River Railroad.
Say “yes” to safer, cleaner, renewable resources.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Robert Daigle

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Lena Fine

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Bruce Robinson

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Billie McFadden

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

David Wood

Sittingbourne, ME9 9LB

Victoria Rutson
Surface Transportation Board

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Louis Freve

, K1S 4E8

Victoria Rutson
Surface Transportation Board

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Coal is the past. Coal is the present. Coal is NOT the future!
Coal has served our nation well, but the time has come to look to the future. Clean, alternative, energy is the future. We have wasted enough time living in the past. It it time to be proactive and think of the future of Appalachia and the whole USA. Please don't waste any more time, money, or effort on coal. Think of the future, a clean future!

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Kam Chapman

The US should NOT be exporting coal: the pollution caused by burning it anywhere in the world affects us. IN addition, we reap the polluted water caused by the likes of Duke Energy in NC. Coal is something we cannot afford to dig up, much less burn,. A railroad to carry it to ports for export is a really bad idea environmentally, Given the other pressures on the coal industry, it seems a bad business decision, as well. We should be investing in PASSENGER RAIL, where our best train, the Acela, is decades behind rail service in every other developed country.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Spreckels, CA 93962

Victoria Rutson
Surface Transportation Board

Please oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad wants to haul coal from the speculative Otter Creek mine at a time when coal prices are low both domestically and internationally. Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years.

The draft EIS erroneously assumes that there is market for high-sodium Otter Creek coal and that there would be no impact from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer from the increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

Say no the Tongue River Railroad. The TRR and coal export only benefit private coal companies and Asian energy users but hurts those who live along the rail line.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

On the other hand, if you choose to approve the railroad, at least please explain to the American people, especially the ones who will be most badly affected by it, how such a project will be of benefit to them, as well as to the American people in general. I ask you to especially explain how the environmental damage done by mining, transporting and especially burning that coal is good thing for ordinary people, as opposed to the big-money interests behind this project.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”
A railroad dedicated to moving coal is a bad idea. There are too many destructive impacts on the land of its route. And, I would hope the USA would stop using dirty coal because it adds greenhouse gases to the atmosphere. Instead of cashing in on cheap coal we could set a good example to other nations by retiring the use of coal.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Jennifer Hughes

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Lori Weber
605 Hale st.
Johnson City, TN 37601

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Evan J. Robertson

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

William Kempf

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction, and one that would have substantial negative impacts on the environment and public health in the area, as well as exacerbate climate change.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. Studies have shown that it is imperative to leave the majority of known fossil fuel reserves in the ground in order to avert the most catastrophic impacts of climate change. The Otter Creek mine would be a disaster for the climate, and allowing construction of the Tongue River Railroad would make this huge mine possible.

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and substantial air pollution from both diesel exhaust and fugitive coal dust, with its associated health hazards.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those communities who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Please stop construction of the Tongue River Railroad,

The Otter Creek mine is speculative. Coal markets are crumbling. Railroad construction will happen only if the Otter Creek Mine is built..

Otter Creek, if mined, will contribute to climate change for the next 55 years.There is no domestic coal market for high-sodium Otter Creek coal

There will clearly be more than zero train traffic impacts from construction of a rail line that will likely transport 18-26 additional coal trains per day. Included must be slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export will benefit only private coal companies and Asian energy users.

It will hurt everyone else.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Mary Anne Combs

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Brent Hepner
720 Pennsylvania Ave.
Norfolk, VA 23508

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Climate change is no longer the subject of enlightened scientific debate. The world must reduce the use of fossil fuels. The worst offending fossil fuel is coal. The US must not worsen climate change by exporting coal ... it is a moral imperative.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Randy Hershey

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,
