Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Thomas Paulson

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Lena Kaijser

, 4538

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Margaret Johnson

We need to leave our coal in the ground as a reserve for the time when global warming is no longer a threat to our very existence. Only then, will we be able to begin the use of coal again in limited amounts and for our own use here in the United States of America -- not overseas!

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Ian Kent

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Salvatore Greco

I live in the pacific northwest. A accident such as a oil spill would be catastrophic. Railways line the sides of rivers throughout the northwest. Thousands of miles! Many of these rivers are prime habitat for Salmon and others species of fish and are priceless for recreation. Extreme care must be taken or some F---ing heads will roll. Don't crap on us and trample on my and millions of others beloved home by allowing blind greed this unethical disregard for the well being of so many and the wildlife and environment should not occur. If it does a accident is not acceptable. Tax payers should not have to pay for upgrades to the railways to accomodate this heavy and over use by those pillaging our natural resources. Yet it must be done. At the very least Make sure they pay!! (coal and oil exporters) Preferably it stops and does not occur at all.
Thank you,

This is the year 2015. It is time to prepare for the future rather than go backwards to last century. It is time to figure out how to shut down coal mines and coal fired power plants. It will not be easy. It will take effort committed to a sustainable future for our children's children. I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The options exist. We must find a way to stop the cloud of greed from distorting our perception of the future. It will be a dark time for our children at this pace. We need change to even have a chance to begin to course correct our environmental crisis. "The path towards sustainable energy sources will be long and sometimes difficult. But America cannot resist this transition; we must lead it...That is how we will maintain our economic vitality and our national treasure—our forests and waterways; our croplands and snow-capped peaks." ~President Obama in his second inaugural address.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Vanessa Aguiar

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

While President Barack Obama talks about putting us on the pathway of a cleaner and more sustainable ('green') energy future (with additional solar and wind capacity, aggressive newer auto fuel economy standards, and the 'Carbon Rule' limiting the carbon pollution from current coal-fired power plants [ALL WHICH I STRONGLY SUPPORT]), the U.S. has been literally flooding the world markets with "cheaper," higher-carbon fuels. [I say "cheaper" because the true environmental costs ("externalities"), such as human-made climate disruption, toxic particulates ('soot'), hazardous heavy metal pollution like mercury, and sulfur oxides, are NOT being entered into the "economic-energy cost equation."] For example: "Since Obama took office, American coal exports are up more than 50 percent." 'KING[POLLUTING] COAL' "has designs to more than double that tonnage by opening a direct export route to Asia, shipping coal strip-mined from the Powder River Basis, in Wyoming and Montana, by rail to a network of planned export terminals in the Pacific Northwest, and then by sea to China." While receiving a great deal less attention than the Keystone XL Tar Sands Oil Pipeline (WHICH ALSO MUST BE REJECTED WITH DELIBERATE SPEED), these newer coal exports would unleash a climate-disrupting 'carbon bomb' almost identical to the "greenhouse gas pollution" attributed to the KXL. The Obama-Biden Administration "opened up more than 300 million tons of coal in the Powder River Basis to bidding by the coal companies last year." [That coal is on publicly-owned land that is administered by the U.S. Bureau of land Management (USBLM).] Please see: Tim Dickinson, "How the U.S. Exports Global Warming," ROLLING STONE, Issue 1202, February 13, 2014, pp. 32-35.
Continuing on, I am one of the original, modern environmental/energy/conservation activist s ever since around the very first "EARTH DAY Celebration" (Wednesday, April 22, 1970), now over 45 years ago! I have a Bachelor of Science (B.S.) Degree in Biology and Environmental Studies from Dana College, Blair, Nebraska. BECAUSE ALL COAL EXPORTS MUST BE HALTED AT ONCE (AND THIS COAL SHOULD BE LEFT IN THE GROUND), I OPPOSE THE CONSTRUCTION OF THE TONGUE RIVER RAILROAD, AND URGE THE SURFACE TRANSPORTATION BOARD (STB) TO TAKE THE “'NO ACTION' ALTERNATIVE!!"

The Tongue River Railroad proposes to haul coal from the speculative Otter Creek Mine at a time when coal markets are crumbling both domestically and around the world. (The Otter Creek Mine is clearly a connected impact of the railroad’s construction.) Otter Creek is the largest proposed coal mine in the United States. It represents ROUGHLY 1.3 BILLION TONS OF COAL that, if mined, would contribute to anthropogenic climate disruption for the next 55 years!

The Draft Environmental Impact Statement (DEIS) INCORRECTLY ASSUMES that there is a domestic coal market for high-sodium Otter Creek coal, and WRONGLY ASSUMES "zero" train traffic impacts from construction of a rail line that could transport ABOUT 18-26 ADDITIONAL COAL TRAINS PER DAY.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air

pollution from both diesel exhaust and fugitive coal dust.

The Tongue River Railroad and coal export only benefit private coal companies and Asian energy users while it hurts those who live along the rail line. IN CONCLUSION, TO REITERATE, PLEASE JUST SAY 'NO" TO THE COAL EXPORTS AND THE TONGUE RIVER RAILROAD IMMEDIATELY!!

Please Protect Our Public Health and Ecological Health! Thank You Very Much!

We should not be making it easier to extract the dirtiest energy around - coal - and make it available to others for burning. It is a great pollutant and adds to climate change. Keep coal in the ground and help the coal industry transition to solutions for our planet.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Dorcey Winant

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Christine Blunt
6721 E Redfield Rd
Scottsdale, AZ 85254

Victoria Rutson

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Kenneth Kavulia

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Peysha Charlwood

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

P. Benavides
601 Reclining Acres Rd.
Corrales, NM 87048

Victoria Rutson

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

Coal markets are decreasing both at home and abroad. The Otter Creek mine is speculative but could contribute to climate change for decades.

The draft EIS has some significant flaws such as assuming a domestic coal market for high-sodium Otter Creek coal and zero train traffic impacts from construction of a rail line. How could 18-26 additional coal trains per day not have an impact?

Rail communities will experience reduction in property values and increase in traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Susanne Berntsson

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Barbie Bazos

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Joanna Kaszycka

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Jane Twitmyer

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

I oppose construction of the Tongue River Railroad, and urge the STB to take the “no action alternative.”

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

The railroad proposes to haul coal from the speculative Otter Creek mine at a time when coal markets are crumbling both domestically and around the world. The Otter Creek mine is clearly a connected impact of the railroad’s construction.

Otter Creek is the largest proposed coal mine in the United States, and represents 1.3 billion tons of coal that, if mined, would contribute to climate change for the next 55 years. The draft EIS wrongly assumes that there is a domestic coal market for high-sodium Otter Creek coal, and wrongly assumes zero train traffic impacts from construction of a rail line that could transport 18-26 additional coal trains per day.

Rail communities between the proposed railroad in Montana and Pacific Northwest export terminals would suffer the consequences of dramatically increased coal train traffic, including slashed property values, increased traffic congestion, safety hazards, and air pollution from both diesel exhaust and fugitive coal dust.

The TRR and coal export only benefit private coal companies and Asian energy users while it hurts those of us who live along the rail line. Just say no the Tongue River Railroad.

Thank you,

Madeline Shikomba
